

# Network attendant service in 3G networks

Minna Bloigu

Supervisor: Prof. Raimo Kantola

Instructor: MSc Joni Rinne

# Content

- Introduction
- Objectives and methodology
- 3G network service architecture
  - UMTS, IMS
  - CAMEL, OSA, SIP, Others
- 3G network attendant service
- Technology comparison
  - Analytical Hierarchy Process
- Results
- Conclusions

# Introduction

- Trio Network Solutions Oy (former Abacus Solutions Oy)
  - subsidiary of Trio AB: 90 employees in Sweden, Finland, Norway and Denmark
  - Trio Listed in Stockholm Stock Exchange
- Trio provides enterprise reachability solutions worldwide
- Trio Network Solutions Oy provides corporate mobile solutions to mobile operators and enterprises
  - Trio Mobile Office is a telephony service from mobile operators. Enables companies to replace fixed telephony with a mobile switchboard function and mobile telephones.

# Operator references

## **Telenor Mobil**

ProffNett

## **Vodafone Sweden**

Vodafones trådlösa kontor

## **TeliaSonera Finland**

Vaihdepalvelu

## **Spring Mobile**

Total, Spring Mix

## **One Austria**

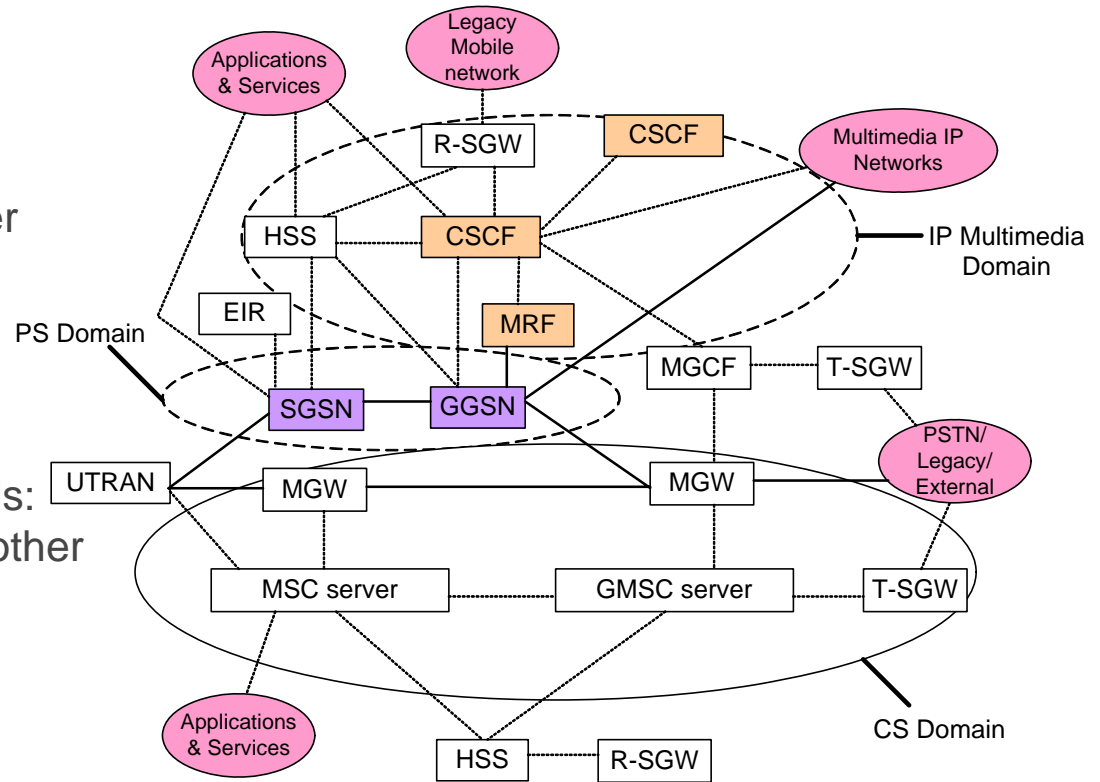

# Objectives and methodology

- Study the implementation of a network attendant service in 3G networks
  - 3GPP Release 5
- Analyse the standardised service delivery platforms and alternative solutions
- Compare the available solutions and propose the most efficient choice for implementing a network attendant service in 3G networks
- Methodology
  - Literature study: 3GPP specifications, books and articles
  - Operator and equipment vendor interviews for market study
  - Current Service Node-based solution as a basis
  - Analytical Hierarchy Process to compare alternatives

# 3G network service architecture

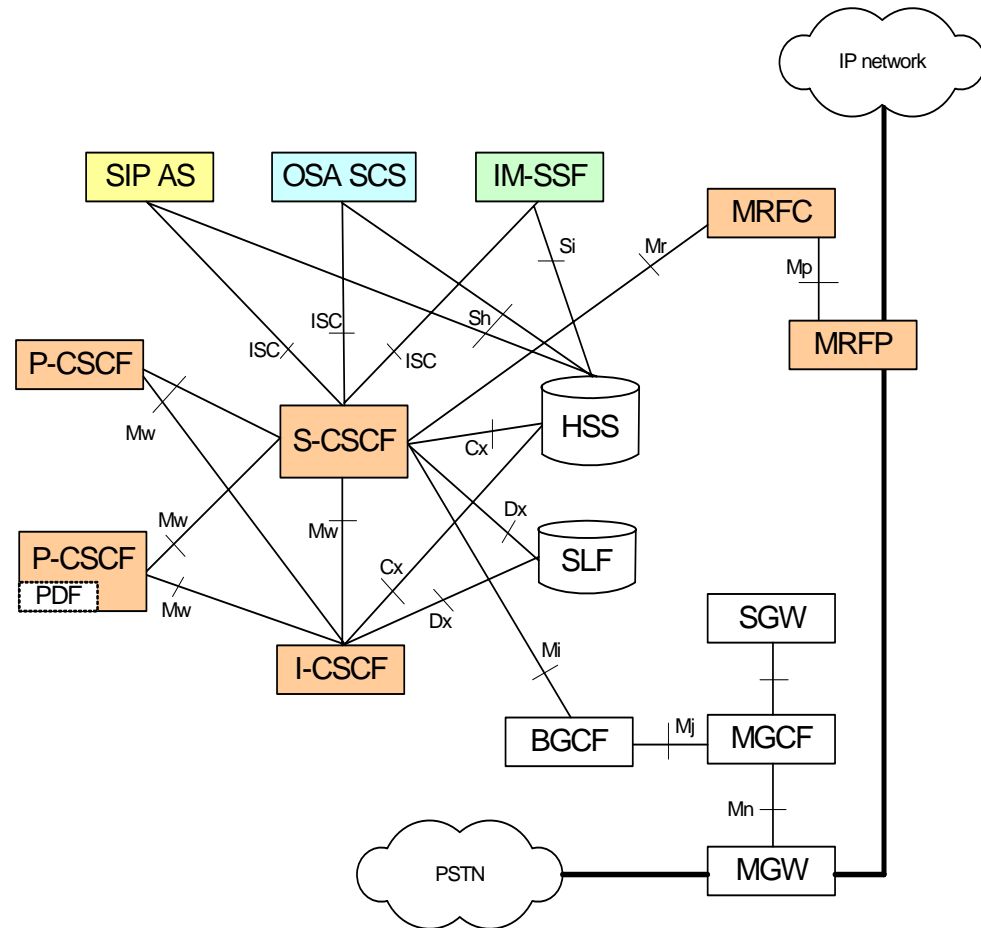

# UMTS Release 5

- Circuit-switched domain
  - Voice and multimedia over circuits
  - IN, CAMEL, SN
- Packet-switched domain
  - IP connectivity to terminals: access to the Internet or other external IP networks
- IP Multimedia domain
  - IM services: multimedia conferencing, voice communications, messaging
  - SIP for signalling

# IP Multimedia Subsystem

- Application servers
  - SIP AS, OMA SCS, IM-SSF
- Proxy-CSCF
  - First contact point btw an IMS terminal and IMS network
- Interrogating-CSCF
  - Contact to the subscriber's home network
- Serving-CSCF
  - Central node of the signalling plane
- Media Resource Function (MRF)
  - Handles media resources
  - MRFC interprets SIP to H.248
  - MFRP handles the media streams
- Media Gateway (MGW)
  - Media conversions btw CS and PS networks: PCM and RTP

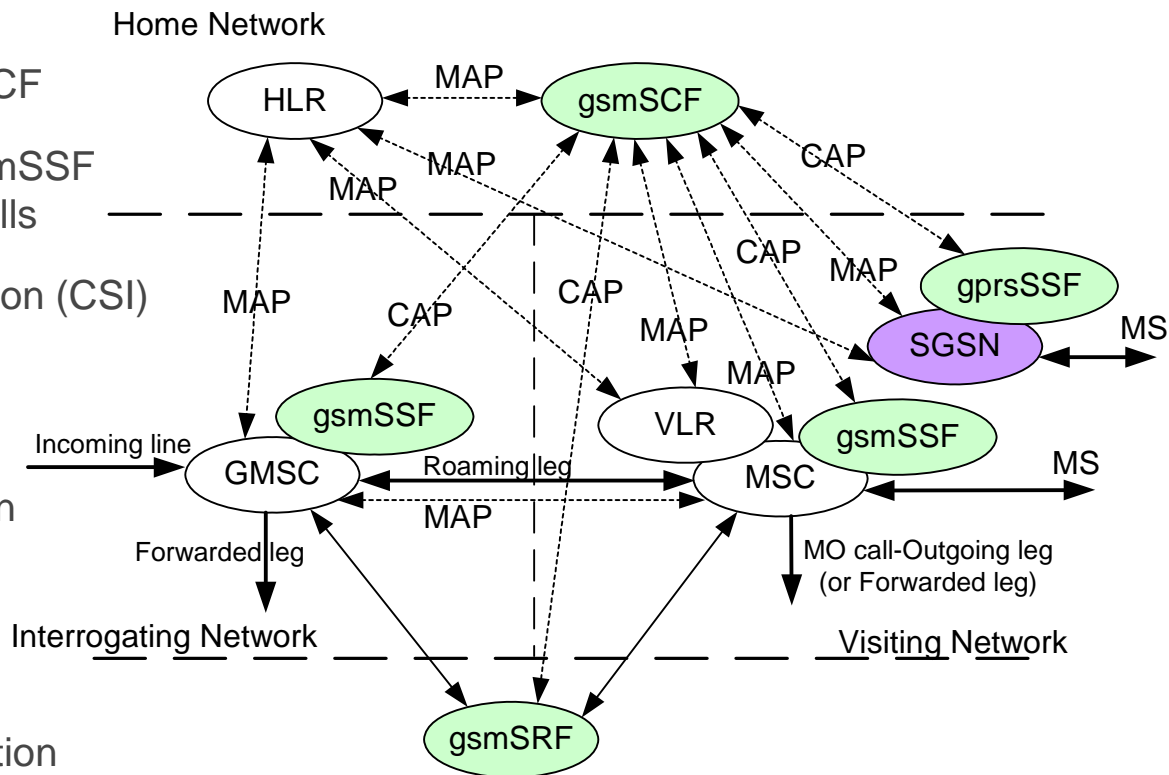

# CAMEL

- Customised Applications for Mobile network Enhanced Logic
- GSM specialised Intelligent Network feature
- Support for Operator Specific Services for roaming subscribers
- Standardised in phases by ETSI
  - CAMEL1(R96), CAMEL2(R97), CAMEL3(R99), CAMEL4(R5)
- Basic Call State Model concept for call handling
- Protocols: CAMEL Application Part (CAP), Mobile Application Part (MAP)
- Services for circuit-switched, packet-switched and IP multimedia domain

# CAMEL phase 4 architecture

- CAMEL service logic in gsmSCF
- gsmSCF interacts with the gsmSSF towards the MSC to control calls
- CAMEL Subscription Information (CSI) stored in HLR
- Specialised Resource Function (gsmSRF)
  - Announcements
  - DTMF
- HLR MAP Any Time Interrogation
  - Subscriber status, location

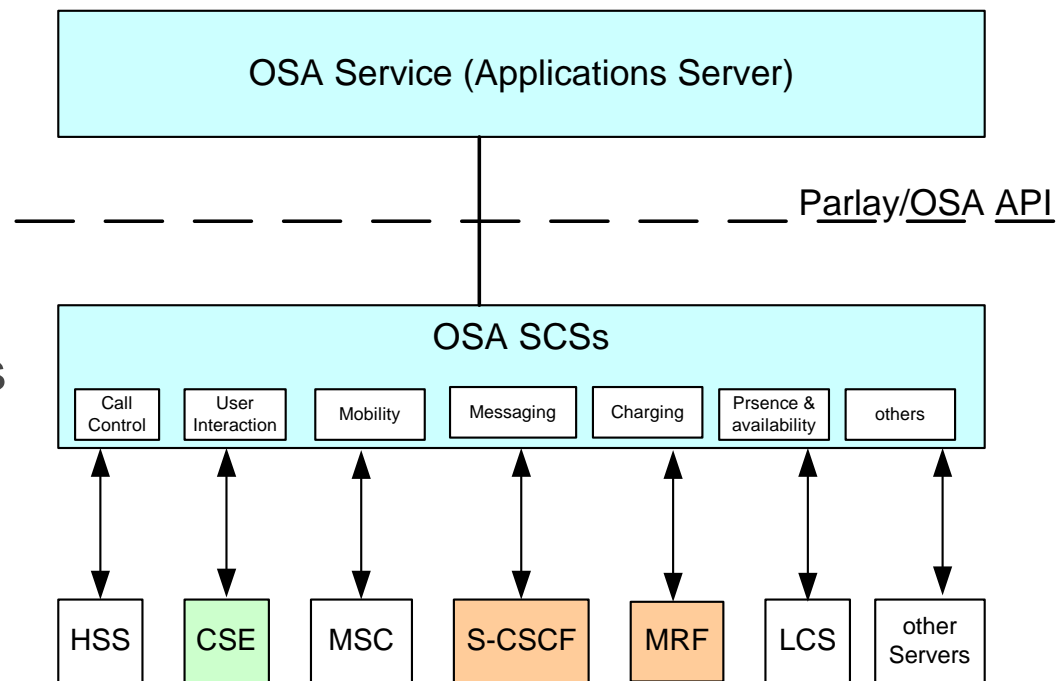

# Open Service Access

- Standardised by 3GPP
- Application Programming Interfaces APIs
- Applications developed by operators or third parties can make use of network functionalities through a set of Service Capability Features (SCF)
- OSA APIs are independent of where or which network capabilities are implemented in the network
- Framework for authentication and authorisation, Discovery
- Only standardised secure method to access network capabilities in IP Multimedia Subsystem (IMS)

# Open Service Access

- OSA applications developed in Application Servers using the OSA APIs to interact with OSA services
- Service Capability Servers (SCS) act as gateways between network entities and applications
- Mapping to network protocols vendor specific
  - MAP, CAP, INAP, Megaco, SIP, SMS

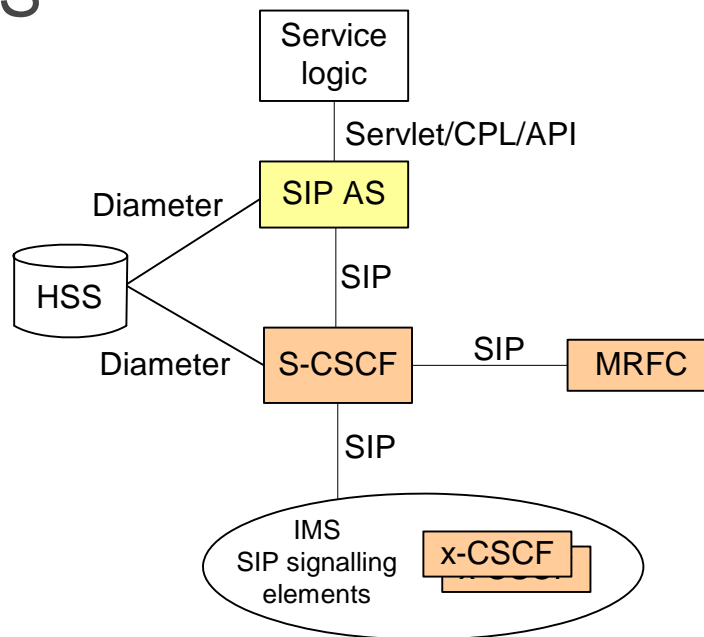

# Session Initiation Protocol

- IETF has defined SIP originally for multimedia call control for the fixed Internet
  - Text-based application layer signalling protocol
- Chosen as the main IP Multimedia Subsystem protocol for call control because of the interconnectivity requirement between 3GPP networks and fixed IP networks
  - SIP used for session control
  - Session Description Protocol (SDP)

# SIP AS service architecture

- Services created in SIP AS
  - Call Processing Language (CPL)
  - Service Creation Markup Language (SCML)
  - SIP Common Gateway Interface (SIP CGI)
  - SIP Servlets
  - JAIN SIP
  - Parlay APIs
  - VoiceXML for user interaction

# Other technologies

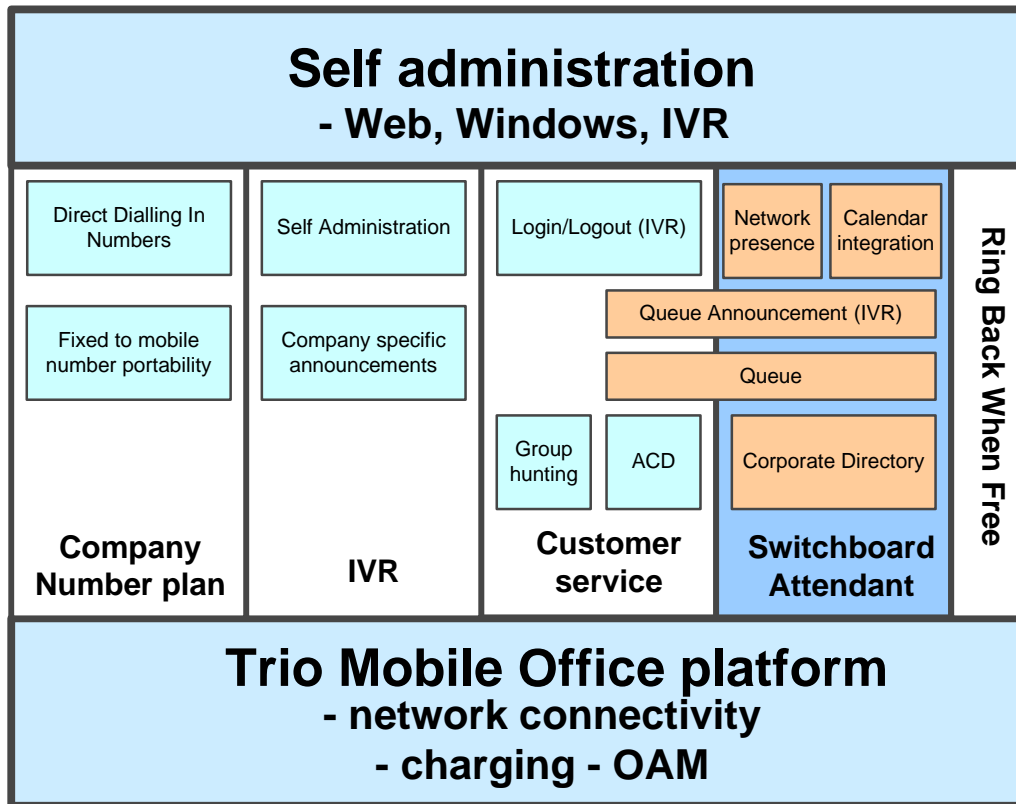

- Java APIs for Integrated Networks (JAIN)
- Parlay X
- Open Mobile Alliance
- Intelligent Networks
- Service Node
- Mobile Execution Environment
- UMTS SIM Application Toolkit

# 3G network attendant service

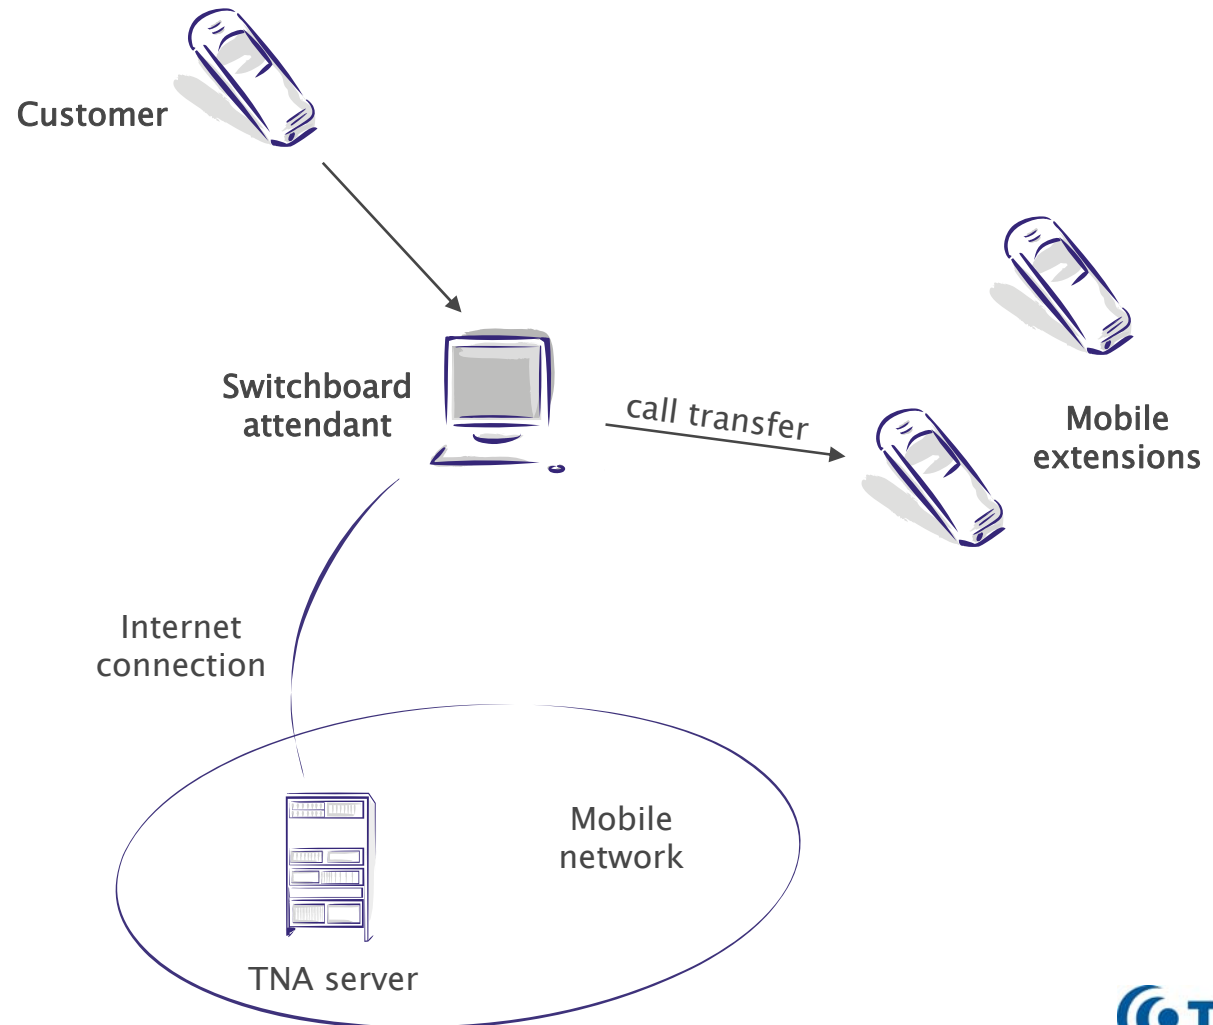

# Network attendant service

- Call handling application for switchboard attendants

- Mobile or fixed phones
- Call handling
- Corporate directory
- Messaging
- Presence information
- Call queuing
- Automatic call distribution (ACD)

# TNA conceptual model

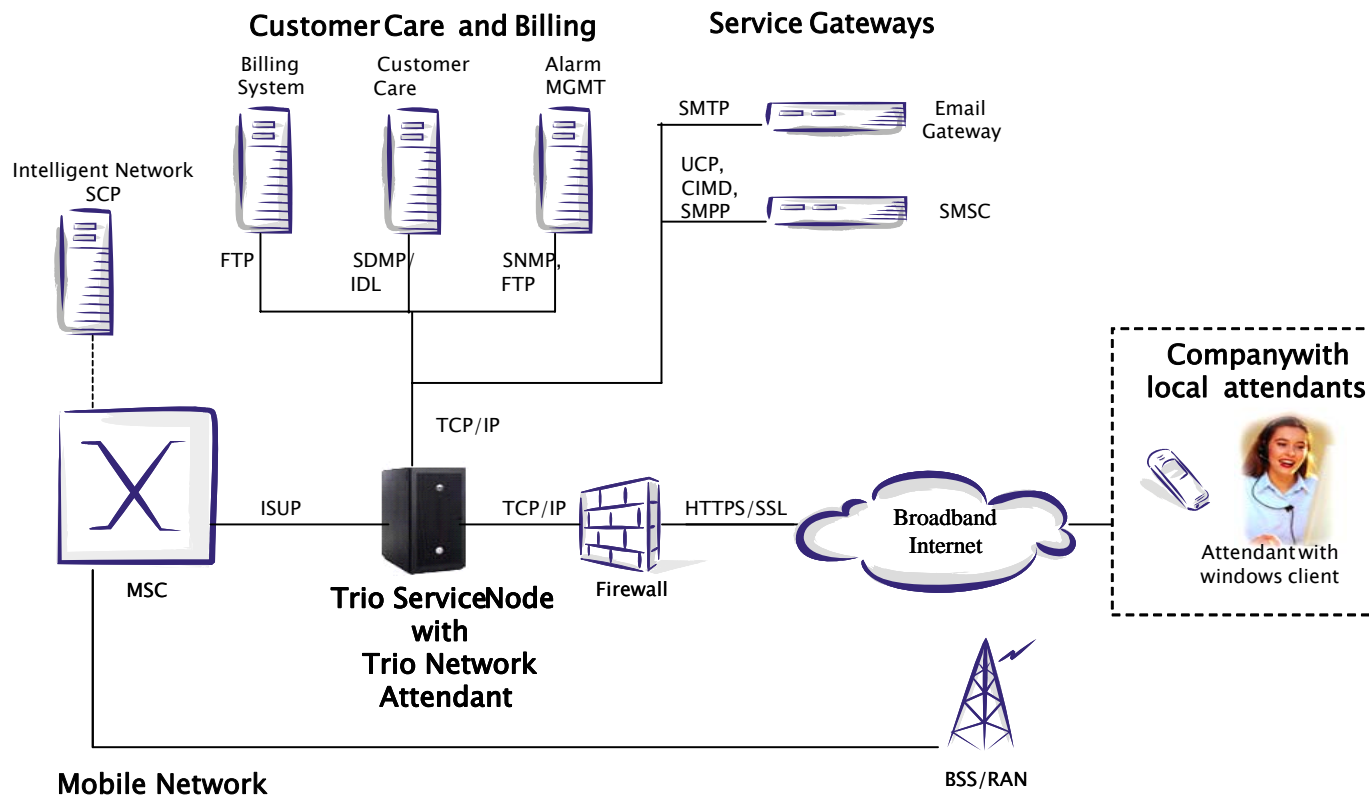

# Network attendant service contd.

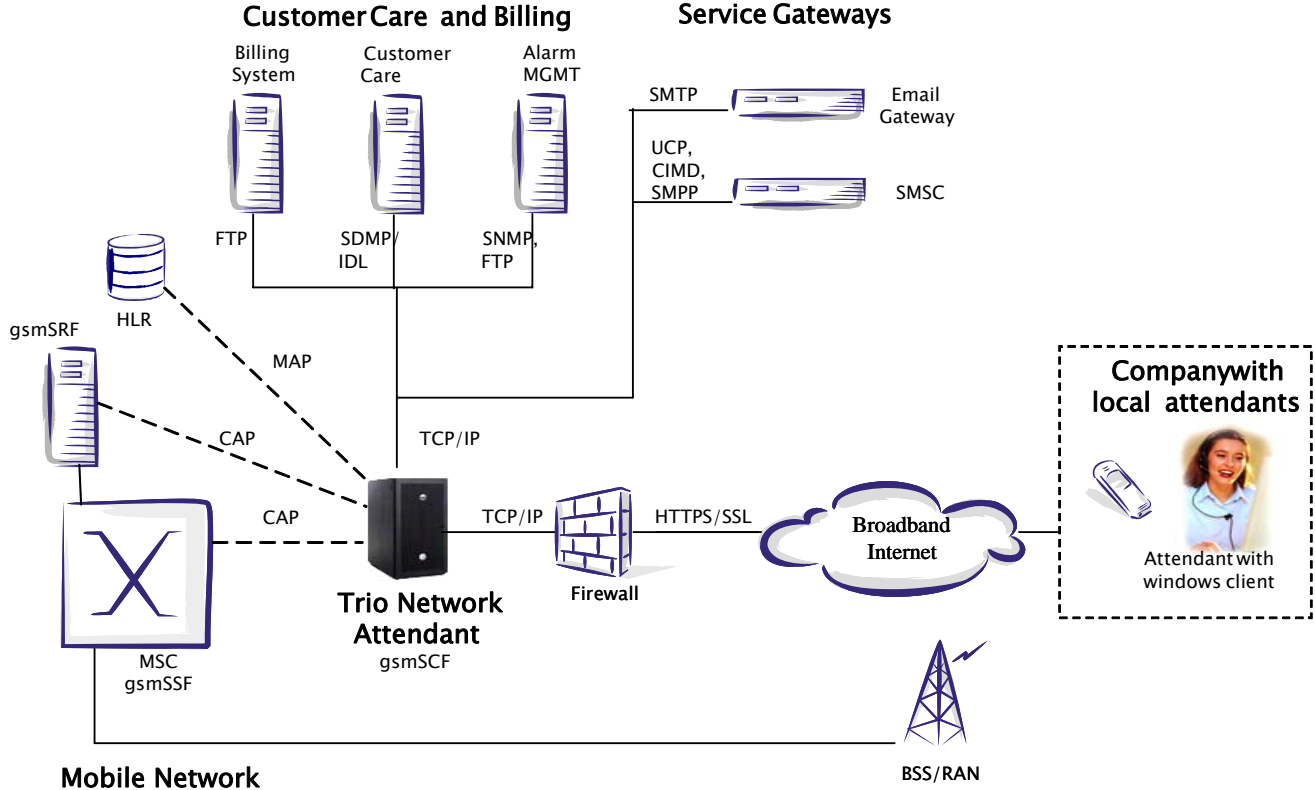

- An attendant establishes an open line between her phone and the Trio Network Attendant System
- Attendant use a graphical user interface, attendant client, to handle calls.
- Call and queue information displayed in the client
- Corporate directory, SMS and email messaging
- Logical call flow:

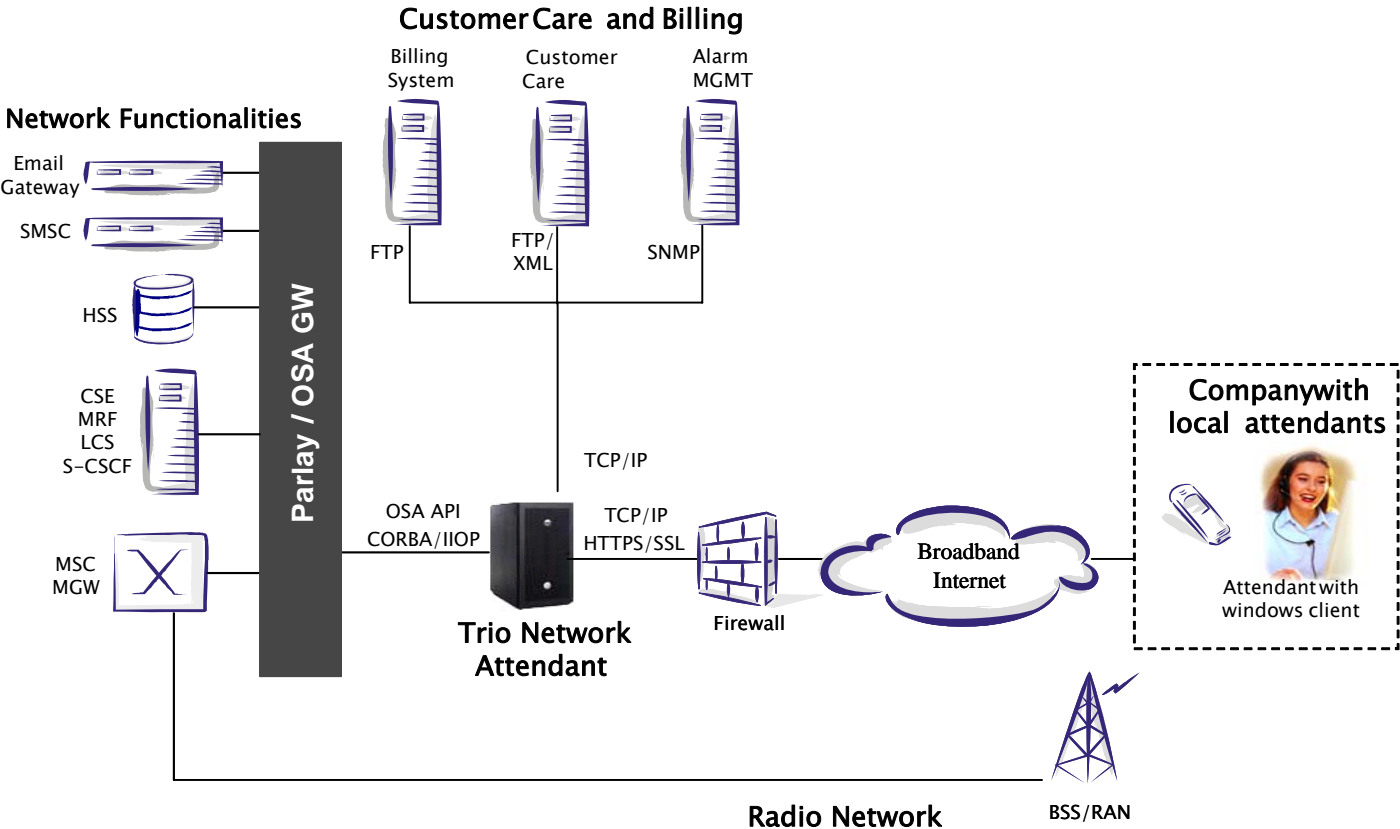

# 2G TNA Architecture

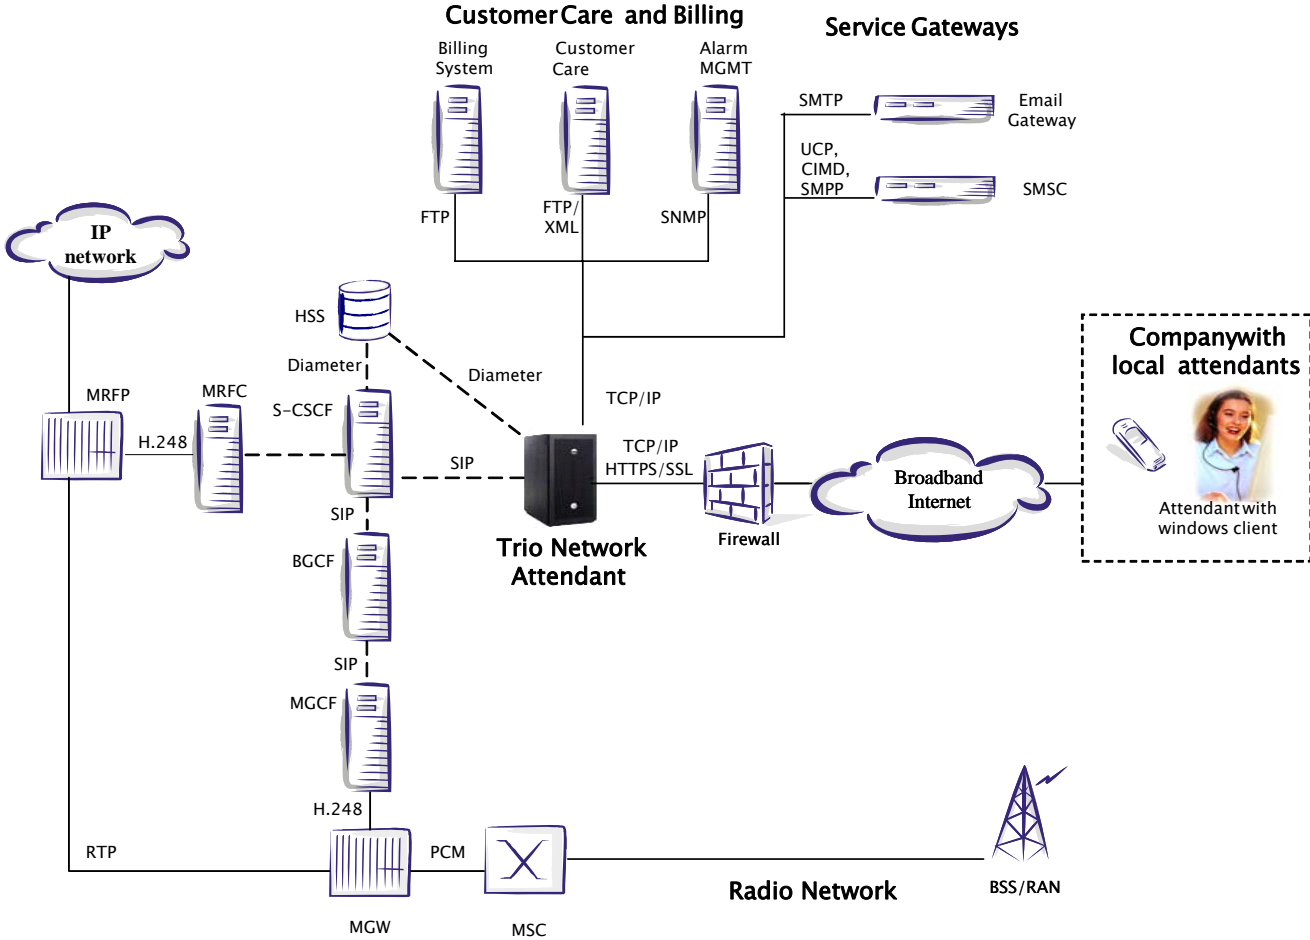

# CAMEL - TNA

# OSA - TNA

# SIP - TNA

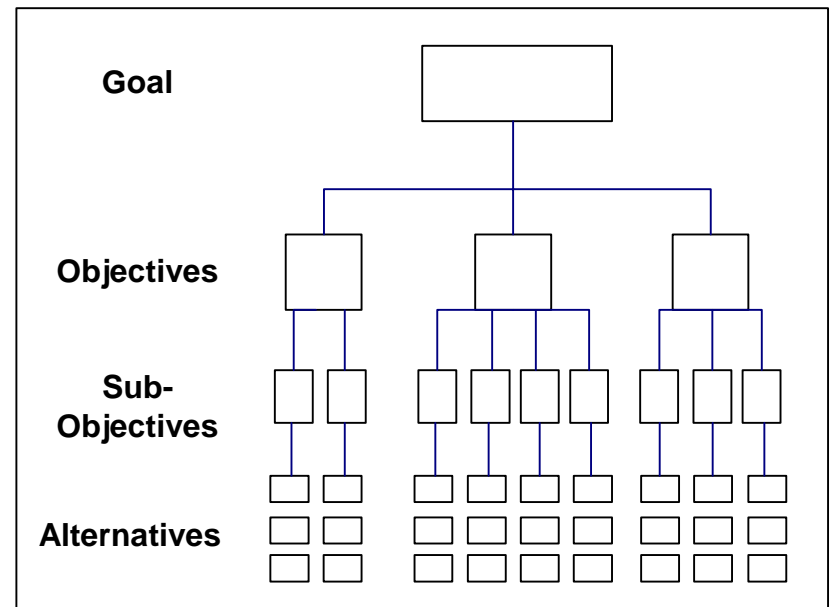

# Technology comparison

# Analytical Hierarchy Process AHP

- Developed by T. Saaty 1980
- A systematic method for comparing a list of objectives and alternatives
- Pie chart model
  - Goal of the decision-making is the whole chart
  - Each wedge represents an objective contributing to the goal
  - AHP helps determine the relative importance of each wedge
- Pairwise comparisons
  - Each pair of factors is compared to establish a ratio of relative importance between the factors

# AHP contd.

- Verbal scale comparison to numerical values

Numerical value	Verbal scale	Explanation
1.0	Equal importance of both elements	Two elements contribute equally
3.0	Moderate importance of one element over another	Experience and judgement favour one element
5.0	Strong importance of one element over another	An element is strongly favoured
7.0	Very strong importance of one element over another	An element is very strongly dominant
9.0	Extreme importance of one element over another	An element is favoured by at least an order of magnitude
2.0, 4.0, 6.0, 8.0	Intermediate values	Used to compromise btw two judgments

# AHP contd.

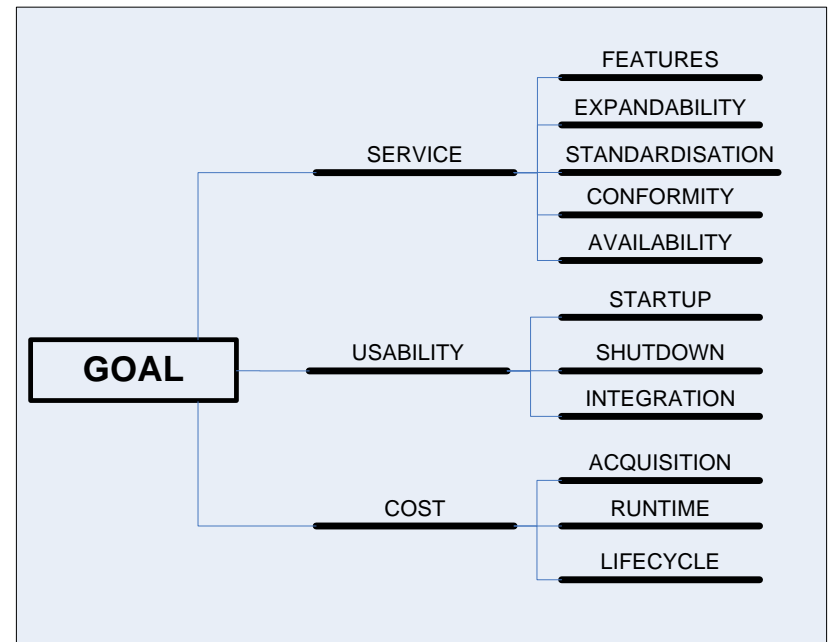

- Form a pairwise comparison matrix A
  - The number in the  $i^{\text{th}}$  row and  $j^{\text{th}}$  column gives the relative importance of objective  $O_i$  as compared with objective  $O_j$

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ a_{31} & a_{32} & a_{33} & a_{34} \\ a_{41} & a_{42} & a_{43} & a_{44} \end{bmatrix} = \begin{bmatrix} \frac{O_1}{O_1} & \frac{O_1}{O_2} & \frac{O_1}{O_3} & \frac{O_1}{O_4} \\ \frac{O_2}{O_1} & \frac{O_2}{O_2} & \frac{O_2}{O_3} & \frac{O_2}{O_4} \\ \frac{O_3}{O_1} & \frac{O_3}{O_2} & \frac{O_3}{O_3} & \frac{O_3}{O_4} \\ \frac{O_4}{O_1} & \frac{O_4}{O_2} & \frac{O_4}{O_3} & \frac{O_4}{O_4} \end{bmatrix}$$

- Vector of weights  $W$
- Eigenvalue problem:  $AW = \lambda_{\max} W$
- Consistency measure calculated using the eigenvalues of the normalised comparison matrix

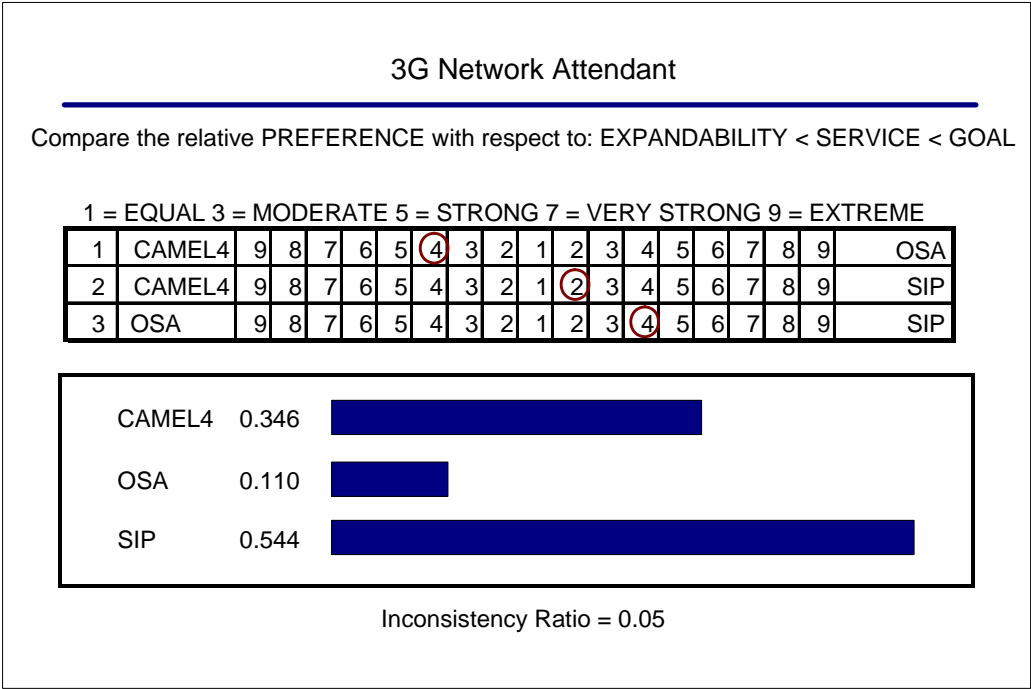

# AHP hierarchy for the network attendant service

- Goal: Select best technology solution for the network attendant service in 3G networks
- Alternatives
  - CAMEL4
  - OSA
  - SIP
- Objectives
  - Service creation and technology benefits
  - System usability and maintenance
  - Cost

# Comparison of alternatives and objectives

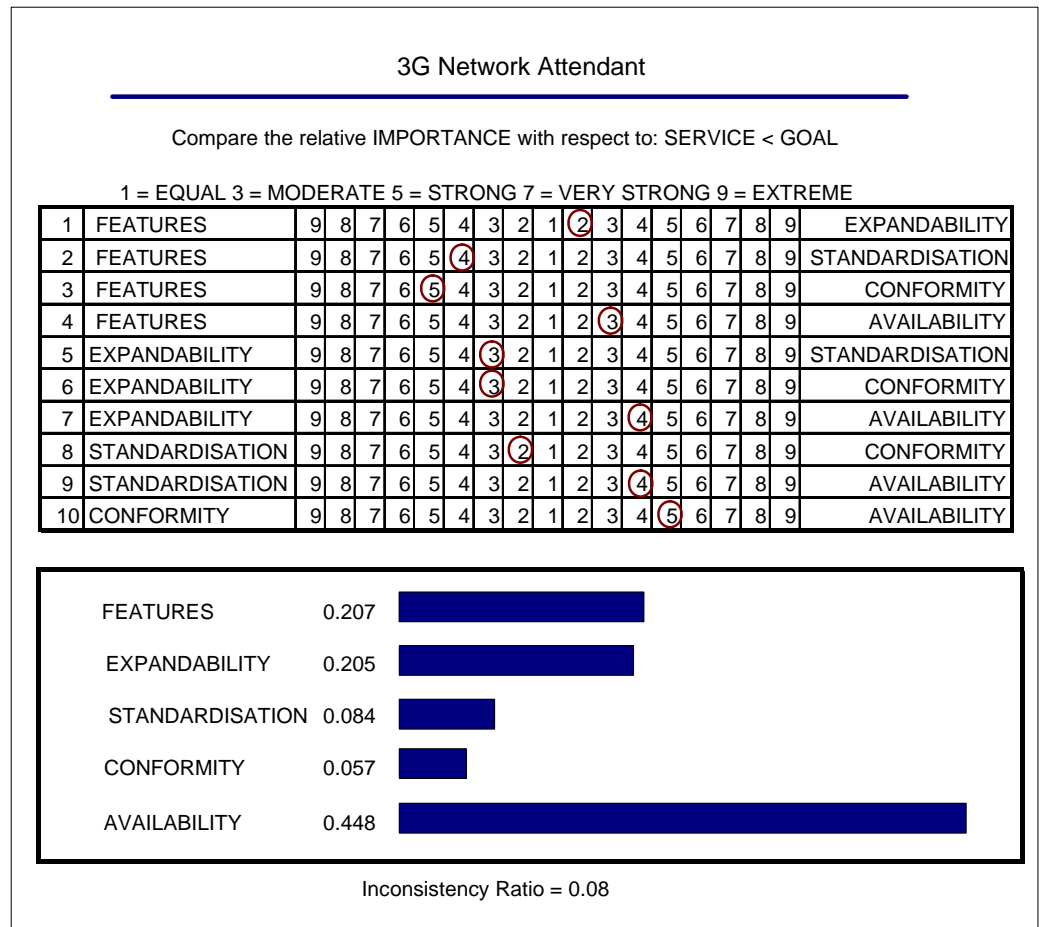

- Compare alternatives first pairwise for each-sub-objective
- Compare sub-objectives pairwise for to get overall importance within main objective
- Compare objectives pairwise for the goal

Judgements and priorities with respect to service expandability

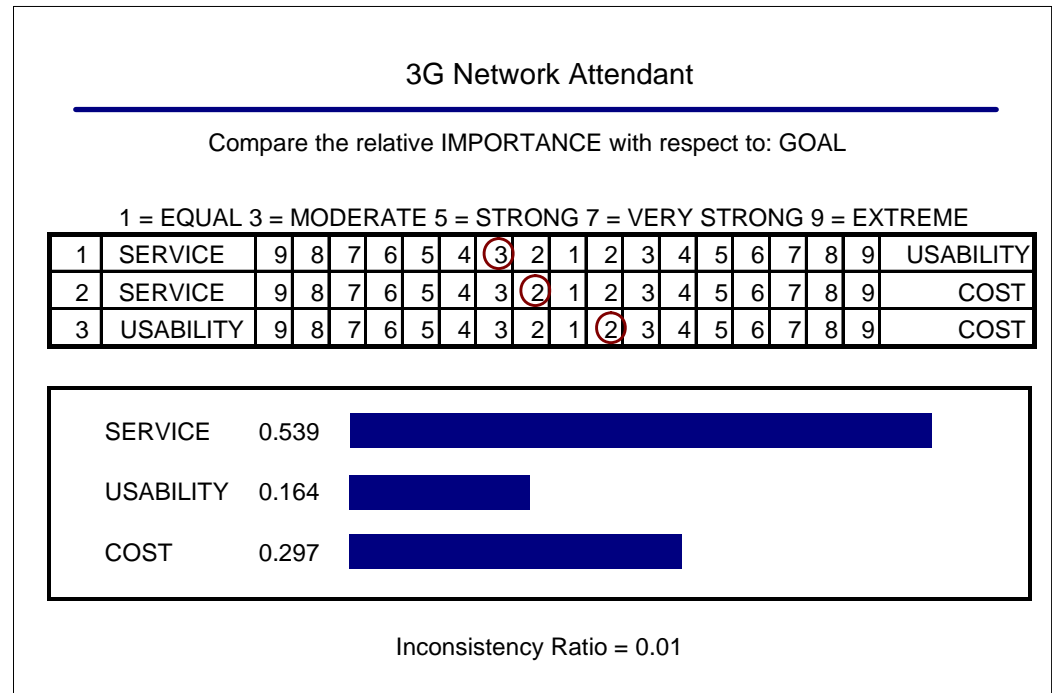

# Comparison of alternatives and objectives

- Compare sub-objectives pairwise for to get overall importance within main objective

# Comparison of alternatives and objectives

- Compare objectives pairwise for the goal

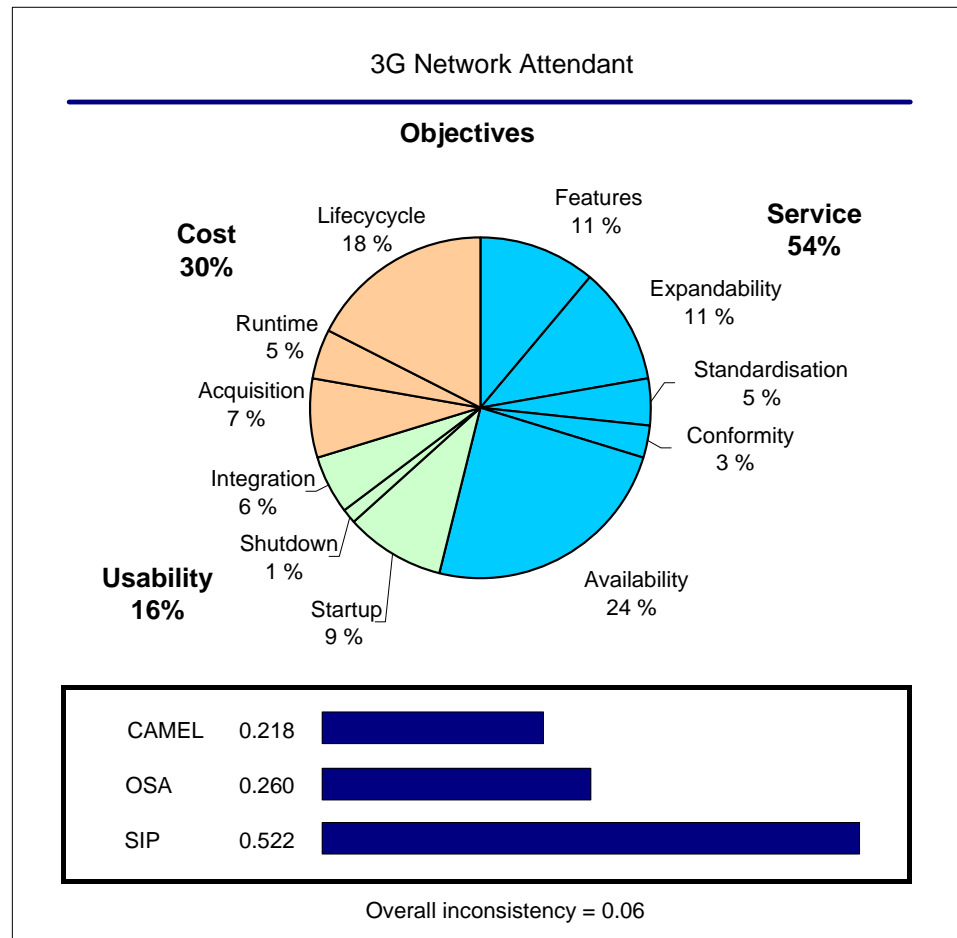

# Results and Conclusions

# Results

- Overall
  - SIP 52%
  - OSA 26%
  - CAMEL 22%
- Objectives
  - Service 54%
    - SIP 52%
    - CAMEL 29%
    - OSA 19%
  - Cost 30%
    - SIP 56%
    - OSA 31%
    - CAMEL 13%
  - Usability 16%
    - SIP 44%
    - OSA 42%
    - CAMEL 14%

# Conclusions

- Overall preference for a network attendant service in 3G networks would be to implement the service in the IP Multimedia Subsystem using a Session Initiation Protocol Application Server
- SIP-based solution was evaluated to offer better service creation and technology benefits than the other compared alternatives and at a lower cost. In addition, it was favoured from the usability and maintenance perspective as well.
- In the overall results, a SIP-based solution favourably satisfied all three main objectives. Hence, it was proposed as the best choice for a next generation attendant service.
- However, if the operators are not going to deploy IMS, there is neither going to be adequate network support nor a market for a SIP-based attendant service.
  - Technology availability in operator networks the most important individual category.
  - Estimated result, more profound market study needed to support the decision-making.

Thank You! ■
